

RQ2.1

Coverage is not a candidate set

Necessary condition tested: the executed lines form a usably small answer set.

Focal — matplotlib-24149

Gold = 2 lines.

Executed in the gold file = 2,104 lines.

'In coverage' $\Rightarrow$ 1 needle in a 2,104-line haystack (0.10% precision).

Even the median crash instance leaves a 259-line haystack.

X selecting from 'executed' $\approx$ picking from a haystack (crash vs. behavioral: only +6.5pp)

Root cause

Data-level faults sit on ordinary executed lines $\rightarrow$ the executed set stays a $\sim$ 259-line haystack, not a candidate set.
