

RQ2.2

Coverage is not a recall upper bound

Necessary condition tested: every gold line is executed, so filtering to executed lines is lossless.

Focal — django-14017

The fix edits a branch-guard (gold lines 43-44).

The gold function `_combine` runs, but the failing input never takes that branch → gold 0/2 executed.

Filtering to executed lines deletes the gold entirely.

✗ filtering deletes off-path gold → recall ceiling is 83.8%, not 100%

Root cause 16% of crash faults edit never-run code (missed branch / insertion / unreachable) — structurally outside any coverage set.
